I need you to act as a senior mobile app developer. Build me a complete, working React Native mobile app (Expo managed workflow) with the following specifications: ## APP OVERVIEW Medical billing app for anaesthetists and their office staff. Phase 1 only: client submits cases, office reviews/com

1:19 AM

Check frontend design skill

Check frontend design skill

This is a solid, well-structured prompt. Let me give you my honest take before you go build this.

The good news: Your prompt is genuinely excellent for AI-generated code. It covers auth, data structure, roles, fields, and file structure. Whoever helped you write it knew what they were doing.

The honest reality check (because you said you need to trust me):

This is not a beginner project. Here's what you're actually signing up for:

1. **Firestore setup alone** has about 15 steps, a billing account, security rules to write, and will break if any one step is wrong.
2. **React Native + Expo** requires Node.js, specific version compatibility, and the Expo Go app on a phone to test. On a good day it works. On a bad day you spend 3 hours on a cryptic error.
3. **The code output** from this prompt will be ~800-1200 lines across 7 files. If anything breaks, debugging it without coding experience is very hard.

My recommendation — two paths:

Path A (what you asked for): I build all the files now. You follow setup instructions. Budget a full weekend and expect frustration. Works best if you have someone nearby who can help debug.

Path B (smarter for your situation): Start with a web app version instead — same features, same Firebase backend, but runs in a browser. No Expo, no React Native version hell. Once it works, converting to mobile is easier. I can build this today and you can use it immediately.

Which do you want?

Also — are you planning to use this yourself (for your own billing practice), or is this a product you want to sell/give to other anaesthetists? That affects how I'd build it.

Future monetisation

1:20 AM

Honest answer: **that changes everything.**

If you want to monetise this — meaning other anaesthetists and offices pay to use it — a React Native Expo app is the wrong starting point for someone new to coding. Here's why:

The real problems with the current plan:

- React Native apps need to be submitted to the App Store (Apple, \$99/year, review process) and Google Play (\$25 once, but still a process)
- Every update goes through app store review
- Firebase costs money at scale and needs security rules written properly or your users' patient data is exposed
- Patient data = POPIA compliance in South Africa. That's a legal requirement, not optional.
- You'd be building on a stack you can't maintain yourself

What successful medical billing SaaS actually looks like:

A **web app** (runs in any browser, on phone or desktop) that you host. Users log in at yourdomain.co.za. No app store. Updates instantly. Cheaper to run. Easier to build.

Before writing a single line of code, you need to answer:

1. Are you targeting SA anaesthetists specifically? (POPIA, medical scheme rules, ICD-10 codes)
2. Subscription model? Per-case fee? Per-practice flat rate?
3. Do you want to build it yourself with AI help, or are you validating the idea first before hiring a developer?

That last question is the most important one. Because if you're validating — I can build you a **working demo** today that looks professional enough to show potential clients and get paying commitments. Then you use that money to build it properly.

What's your actual next step — demo, or production build?

1. South African medical professionals (each specialty as base, but they each need their own format)
2. Open to suggestions. I thinking tiered (future will have more functions)(we can do case batches 1-50 = Rxx, 51-100=Rxx)
3. myself with ai (if demo is workable as I already have a client to test)

1:24 AM

Perfect. You have a real client to test — that's the right way to do this.

Here's my straight recommendation:

Build the demo as a web app today. Your test client uses it in their browser. You learn what they actually need vs. what you thought they needed. That feedback is worth more than months of planning.

On pricing — your tiered idea is solid but tweak the model:

Instead of per-case batches (which is hard to track and invoice), consider:

- **Per practice per month**, tiered by case volume
- E.g. 0–50 cases = R299/mo, 51–150 = R599/mo, 151+ = R999/mo
- Simpler to bill, predictable revenue, scales naturally

Batches work too but monthly subscription is stickier — they forget to cancel.

On the "each specialty needs their own format" problem:

This is actually your product's core feature and competitive advantage. Don't try to build all specialties at once. Build anaesthetics perfectly for your first client. Then when a cardiologist or gynae asks — you add their form fields as a new template. Same backend, different front-end forms. Charge more for each specialty module.

What I need from you before I build the demo:

1. What does your test client actually do today — paper forms? WhatsApp? Excel?
Knowing their current pain tells me what the demo must nail.
2. Do you have a name for this yet?
3. Logo/colours, or busy — I'll just make something clean?

The demo will be a single HTML file they can open in any browser. No install, no Firebase yet — just the interface and flow working. Real data comes in Phase 2.

Images hidden in shared chats

We had an app that was run by a fiver dev but i have no clue where it is now. The client gets paper forms at the hospital and then needs to load it for my company to bill.

GasTrack (Footer to read: Built by MediBurgh)

1:32 AM

Love it. **GasTrack** is a great name — clean, specialty-specific, memorable.

So the workflow is clear:

- Anaesthetist does a case at hospital → gets a paper form
- Goes home/office → logs into GasTrack → captures the form digitally
- Your company (MediBurgh) sees it → bills it

That's exactly what I'm building. Let me get two quick answers before I start:

1. The paper form fields — which of these does it typically have? (tick what applies, add anything I'm missing)

- Patient name
- Date of surgery
- Hospital/facility name
- Procedure description
- Procedure/tariff code (e.g. 0090)
- Diagnosis/ICD-10 code
- Medical aid name + membership number
- Start time / end time (anaesthesia duration)
- Assistant's name
- Fee amount (or do you calculate it?)
- Referring doctor
- Anything else?

2. Your test client — are they the anaesthetist capturing cases, or are they on the MediBurgh/office side reviewing them?

Once I know the fields I'm building the demo. Steel/teal colour scheme from the logo, clean professional layout, MediBurgh footer.

Images hidden in shared chats

Hospital Sticker

- Patient name
- Date of surgery
- Hospital/facility name
- Medical aid name + membership number Doctor writes on form
- Procedure description (dr writes)
- Procedure/tariff code (e.g. 0090)
- Diagnosis/ICD-10 code
- extra codes (modifiers)
- Start time / end time (anaesthesia duration)
- Assistant's name
- Fee amount (or do you calculate it?) (we set it up as a practice profile)
- Referring doctor (no need just surgeon)
- Anything else? (bmi info, all blocks, any additional notes)

Show more

1:37 AM

Perfect. I can read that form clearly. Building now.

V

Connecting to visualize...

That's your working demo. Here's what's in it:

Anaesthetist side — log in, see your dashboard stats, submit a new case with all the fields from your actual paper form (including ASA, start/end time, modifiers, BMI), view all cases, and see messages from the office.

Office side (MediBurgh) — log in as Office, see all cases from all doctors, mark them as billed, or send a "need info" message that appears on the doctor's dashboard. Settings tab has the account number field with the billing system verify placeholder.

To demo it: click Sign in (any email/password works), pick Anaesthetist or Office role. The form fields match exactly what's on the paper form in your photo. Try submitting a new case — it appears in the table immediately.

What this demo doesn't have yet (Phase 2):

- Real login/accounts (Firebase)
- Data that persists when you close the browser
- Reply threading on messages
- PDF/print of the case form
- Actual billing system integration

Your next step: Show this to your test client as-is. Ask them: does the form match what they fill in on paper? Is anything missing? That feedback tells us exactly what to build for real.

Want me to adjust anything — fields, layout, colours — before you show it?
